## Detail analysis of crashme.exe

Posted by sudhir - 05 Mar 2010 - 11:28

---

Hi

Can you please elaborate how to analyze dump using Crashme.exe  
it will be very helpful.

Regards  
Sudhir

Sudhir,

welcome and thanks for your input. In fact an article about setting up WinDbg and analyze CrashMe and its crash dumps is the very next thing I will do over the next weeks.

I hope to see you around,  
Robert

We are waiting for the article about the analysis of the CrashMe,  
Thank you.

My development machine is Win2000sp4. My development environment is VC6sp6. Does anyone have

---

a version of CrashMe for VC6?

Your article "WinDbg From A to Z" is very inspiring!

Hello everybody

I can't see 10 Mb memory in dump which allocate operator new.

I do next step

- 1) Start "CrashMe.exe" in debug mode
- 2) Attach with WinDbg
- 3) Press button "operator new\*"
- 4) Press Break button in WinDbg
- 5) Print command in command window "!heap -stat -h 0"

In result set no row with size 0xA00000. What is wrong?

Thanks for reply

Hi Robert,

Firstly, thanks for compose this good sample to help us learn more.

I'm writing the tutorials for this CrashMe, but I'm having an question which make me cannot go on.

Would you mind to give me an minute to help me clear it?

Button "Test Calling Conventions \*"'s click event handler

CCrashMeDlg::OnBnClicked\_CallingConvention(),

I cannot image out the calling convention will change the results and make the nParam1 to 9, I just can hack into the assembly and edit the instruction save the binary file or just modify the register value when in debug mode.

I will be appreciated your help!

Thanks!

PS: <http://mikedoszhang.blogspot.com/> this is my blog, and I'm writing the tutorials in my this blog, welcome your comments, thanks again, Robert
